## **Inrush Current Limiter, Inrush Current Protection**

For capacitive loads, 230Vac 16A, 16 ⅓ Hz – 440Hz, - 40°C ... +55°C

### **Short Specification:**

- Peak- / R.M.S. inrush current limiter
- 184-264Vac, 16A continuous
- Power consumption 1,1W @ 230Vac
- DIN TS35mm DIN-Rail
- Wall mount (universal case)
- Spring-type terminals 4mm<sup>2</sup> / 12AWG
- Integrated bypass relay
- Capacitive load 2.200uF & 5.000uF
- Integrated thermal protection
- IP20 UL94V-0 case DIN43880  
for DIN/VDE0603 cutout box
- EN62368-1, EN55032 class B

**16 ⅓ Hz – 440Hz**

**No simple NTC-solution!** It allows to reduce cabling sections and to install fast circuit breakers. 100% protection from tripping pre-installed circuit breakers or burning relay and line switch contacts.

The ESB001 is a budget-priced inrush peak current limiter for high loads in LED-applications, complex automation systems and in the machine building. The ESB001 offers effective and interference free operation with capacitive loads. It is simple to integrate into existing equipment. The ESB001 is self-powering and does not require an external power supply.

### General Description

The CAMTEC ESB001-series are the 3rd generation of cost-effective inrush current limiters. The limiters are made for 230Vac 16A networks. The line frequency range is 16 ½ Hz – 440Hz. The ESB001-Limiter shall be located between the line-switcher/contactor and the load (Fig.1). The ESB-models are designed for capacitive loads (not for inductive loads like coils/transformers, not for AC-motors and not for DC-voltage application). In the moment of switching-on the system the inrush current of the installed load will be limited for the defined time  $T_{on}$  (Fig.4). Note that the inrush current limiting of the ESB is not affected by the inrush level of the load. The inrush limiting level of the ESB001 has always priority to the inrush level generated by the load. After  $T_{on}$  elapses the current limiting circuit of the ESB001 will be bypassed. Then the load is directly connected to the AC network. If an AC dip overshoots the defined time  $T_{off}$ , it will be detected by the ESB001 (Fig.5). As soon as the AC recovers the inrush will be limited again (Fig.2 & 3). The ESB001-models provide an internal temperature control. In case of a failure the device shuts down to safely prevent from overheating or fire.

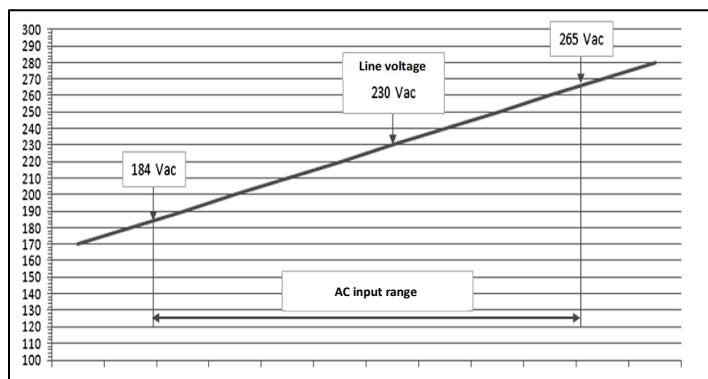

Although the ESB001 detects an AC dip, it does not have an intelligent measuring circuit. Therefore, in bypass mode, the ESB001 cannot detect current coming from the connected load. The ESB001 must be switched on together with the load to be effective.

(Fig.1)

### Field Applications

The ESB001 limiter enables the connection of significantly more capacitive loads (e.g. LED power supplies / LED drivers) to a pre-installed circuit breaker CB (Fig.1). The ESB prevents the MCB from being tripped. This happens independently of the targeted output current. As a result, the number of AC feeders and the pre-installed MCB can be drastically reduced. The installation costs are reduced in the long term. Alternatively, the cross-section of the branch circuits can be reduced if smaller and faster-responding circuit breakers are used. The cost savings in copper are substantial. Sensitive AC networks can be protected more safely (e.g. traffic control systems, street lighting, parking lots and tunnels). When the ESB001 is installed correctly, the neutral conductor (N) is looped through (Fig.1). The switch-on protection circuit always acts on the line conductor. The load refers to the AC current in such a way that a circuit breaker or a residual current circuit breaker operates within the limits of the legal regulations. This also applies to the response of the limiting circuit. The ESB001 is designed for capacitive loads only. The ESB001 cannot be used together with transformers, coils, AC motors and drives, heaters, resistive loads or with DC voltage or with gas induction lamps.

## ESB001 MANUAL

### Design-In of the ESB001 into A/C networks

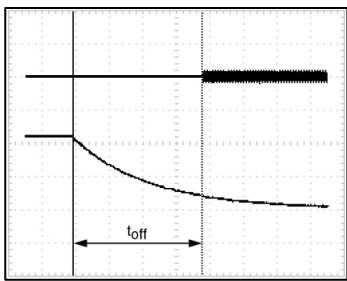

The ESB001 models are the precise inrush current limiters with an overall tolerance of  $\pm 6\%$  of the rated value. For the sizing of an upstream circuit breaker, the R.M.S. is the key value of the inrush current, not the peak current. The thermal trip point is not reached even when a fast circuit breaker is used. The magnetic trip current is the decisive factor. Using the empirical formula  $I(\text{peak}) \times 0.707(\text{factor}) = I(\text{r.m.s.})$ , the tripping current can be accurately determined. It should be noted that the higher the inrush current, the faster the input capacitor is loaded by several connected switching power supplies. The technical table on page 2 shows the RMS value of all ESB001 types and models.

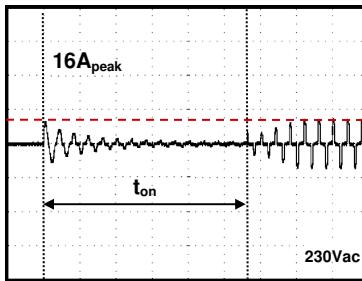

(Fig.4 limiting time  $T_{on}$ )

(Fig.5 inrush without ESB001)

(Fig.6 AC dump detection  $T_{off}$ )

(Fig.7 inrush with ESB001)

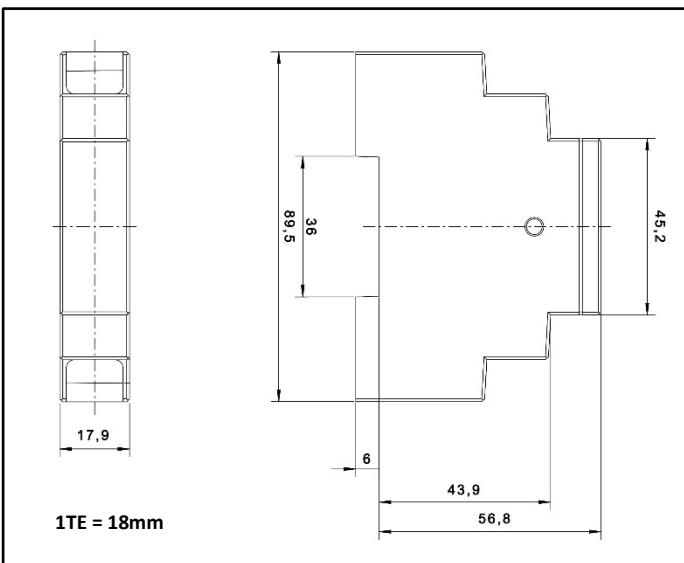

**Fig.5 and Fig.7**

Fig.5 and Fig.7 show the typical start behavior of an NTC-protected switch mode power supply as an empirical example.

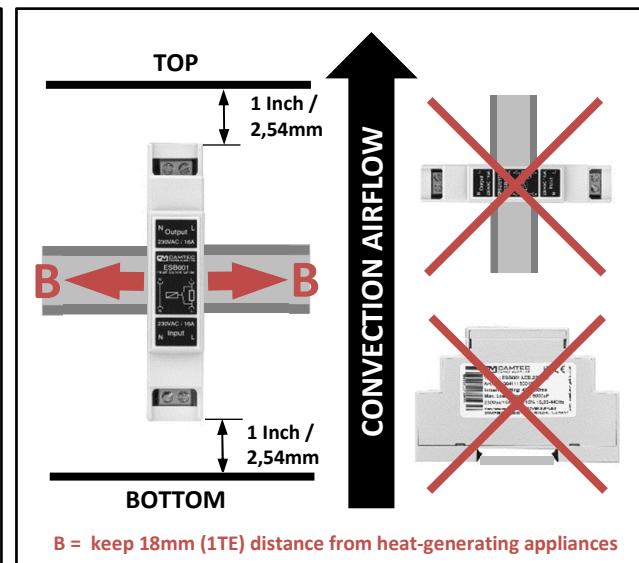

The peak current records show the precise limitation of the inrush current from the former 62Apeak to 16Apeak. The corresponding R.M.S. level responsible for magnetic circuit breaker (MCB) tripping is reduced by a factor of 0.707. After the time  $T_{on}$  has elapsed, the power supply transitions cleanly to continuous operation. Now the current is absorbed from the AC supply in a pulsed manner. The full-load RMS current draw of the example power supply reaches 9.8A at 230Vac.

### Mechanics

IP20 housing, UL94V-0 ABS housing for DIN/VDE0603 cutout box and wall mount. DIN 43880 with IEC standardized ventilation slots. Save fix on DIN-Rail TS35mm (7.5/15) DIN/EN60715. It is designed for building cabinets DIN/VDE0603.

## Connections

### Clamping Yoke Connector Specifications

		Input / Output connections
Tightening torque min. – max.		0,5 – 0,6 Nm (blade 0,5x3,5 DIN5264 )
Clamping range, min. – max.		0,2 – 4,0 mm <sup>2</sup> / AWG24 – AWG12
Solid, H05(07) V-U min. – max.		0,2 – 2,5 mm <sup>2</sup>
Stranded, H05(07) V-U min. – max.		0,2 – 2,5 mm <sup>2</sup>
w. plastic collar ferrule, DIN 46228 pt 4 min. – max.		0,25 – 2,5 mm <sup>2</sup>
w. wire end ferrule, DIN 46228 pt 1, min. – max.		0,25 – 2,5 mm <sup>2</sup>
Pitch (P)		5,08mm

### Wire Stripping Length (fine wired)

Nominal Cross Section	Wire End Ferrule	Stripping Length
0,5mm <sup>2</sup>	H0,5/6	6mm
0,75mm <sup>2</sup>	H0,75/6	6mm
1,0mm <sup>2</sup>	H1,0/6	6mm
2,5mm <sup>2</sup>	H2,5/7	7mm

The length of ferrules is to be chosen depending on the rated voltage. The outside diameter of the plastic collar should not be larger than the pitch (P)

### Mounting Instructions

Follow the above mounting restrictions to allow maximum lifetime of the product and to prevent from tripping the internal temperature protection fuse. The ESB001 is an active device. The distance between an ESB001 and the next active or temperature sensitive device shall be 17,5mm or larger. The power consumption of the device is constant at continuous operation (1,1W @ 230Vac). Make sure that the ventilation holes below and above the unit are not blocked to allow free air convection.

**Safety regulations: Please read these instructions completely before using the equipment. Keep these instructions on to hand. The device may only be installed by trained specialist staff.**

**Installation:**

- 1) The device is designed for devices and systems that meet the standard requirements for hazardous voltages, power, and fire prevention.
- 2.) Installation and service only by trained persons. The AC power must be switched off. The work is to be labelled; accidental reconnection of the system must be prevented.
- 3.) Opening the device, its modification, loosening bolts, or operation outside the specified herein specification or in an unsuitable environment, has the immediate loss of warranty to follow. We disclaim any responsibility for any resulting damage to persons or things.
- 4.) Note: The device must not be operated without an upstream circuit breaker (CB). The CB must not be larger than 16A.

**Warning:**

**Non-compliance these warnings can result in fire and serious injury or death.**

1. Before connecting the device to the AC network, make wires free of voltage and assure accidentally switch on.
2. Allow neat and professional cabling.
3. Never open nor try to repair the unit. Inside are dangerous voltages that can cause electrical shock hazard.
4. Avoid metal pieces or other conductive material to fall into the item.
5. Do not operate the device in damp or wet conditions
6. Do not operate the unit under EX-conditions.
7. Do not operate the unit with then capacitive load.
